## 1 Introduction

Exploit kits (EK) are typically used to distribute malware and other malicious programs to large numbers of victims using existing vulnerabilities in commonly-used browsers. Once a user visits the exploit kit's web page (landing page), multiple techniques are used to identify the browser version and operating system. With this information, the system picks a suitable exploit that might allow for command execution on the victim's device. Subsequently, this action is, in most cases, used to install malware on the computer.

This report explores information related to the victim statistics, operation, C&C server, and technical aspects of one of the well-known exploit kits, **RIG EK**. Most notably, the RIG EK manages the software distributing exploits and collecting victim data in their control panel called **RKIT**. This name can be seen in the HTML page's title and occurs in the control panel's top-left.

Many reputable sources have already provided valuable analysis into the inner workings of the RIG EK and taken action against them via organized take-downs of their landing pages. However, RIG has recently resurfaced and continues to distribute malware to hundreds of victims daily.

RIG EK is a financially-motivated program that has been active since 2014. Although it has yet to substantially change its exploits in its more recent activity, the type and version of the malware they distribute constantly change. The frequency of updating samples ranges from weekly to daily updates.

In general, this report aims to provide insight into how RIG EK operates, what kinds of malware it distributes, and how the distribution happens. The PTI team has identified and gained visibility of the control panel of RKIT, which revealed threat actors' inner workings and identities.

Please note that this report has two versions. The "*Private Release*" is provided to law enforcement agencies, applicable CERTS / CSIRTS, and members of our U.S.T.A. Threat Intel Platform (with appropriate annotations and reductions). Likewise, the "*Public Release*" is publicly disseminated for the purpose of advancing the global fight against high-end threat actors and APTs.

## 2 Executive Summary

Even though we like to think that the amount of machines running software with 0-day vulnerabilities has significantly declined in the past decade – thanks to rolling security updates and better security research – that is, sadly, not the case. There still remains a considerable amount of machines worldwide running outdated and vulnerable software – especially Internet Explorer.

RIG EK uses this untapped goldmine by exploiting machines that run outdated versions of Internet Explorer. Threat actors pay the RIG EK administrator to install their malware on victim machines. So far, this has proven to be a very profitable business model for the RIG administrator and the threat actors.

The operators of the RIG mainly use malvertising to ensure a high infection rate and worldwide coverage. Victims' initial infection occurs when they visit a site that has been compromised or when they visit an advertising page that RIG EK controls. Once they access the landing page, the site determines whether the browser is vulnerable. If not, the user remains unaffected. However, if a vulnerability is detected, they are then redirected to one of RIG's proxy servers which communicate with the exploit server that sends the exploit for that browser version.

Since the exploit server tracks every request sent to it and synchronizes the victim data with the C&C, the system stores the connection time, IP, OS, Browser version and information on whether exploitation was successful or not for each user. All of this allowed the PTI team to conduct an extensive analysis of the logged data.

The artful design of the Exploit Kit allows it to infect devices with little to no interaction from the end user. Meanwhile, its use of proxy servers makes infections harder to detect. These two features combined turn RIG EK a significant threat to corporations and end users.

RIG EK has been observed dropping multiple types of malware, including stealers, RAT, cryptocurrency miners, and banking malware. The C&C server allows for auto-updating the malware by providing a download URL. Because of this feature, the server samples get updated frequently, ranging from daily to weekly updates. Moreover, RIG EK also has an integrated Antivirus testing feature which controls for malicious software whether any popular antivirus software caught it.

One of the most prominent types of malware that RIG has been observed dropping is **Dridex**. After close inspection, it appears to be one of the most well-maintained malware with the most regular updates, with a new version being released daily. Moreover, when the PTI team analysed extensively, they observed that the RIG administrator had taken additional manual configuration steps to ensure that the malware was distributed smoothly. Considering all these facts, we assess with **high confidence** that the developer of Dridex malware has a close relationship with the RIG's admins.

### 3 The RIG Timeline

RIG is a very old exploit kit with a journey that went on for several years. Even though it went through several ups and downs, it is still going strong. A very general overview of what happened during its lifetime can be seen in **Figure 3**. In this section, we will be going over the key points in more detail.

#### 3.1 First Release

RIG EK was initially released in 2014, on several forums. It promoted several exploits in its arsenal, including but not limited to **CVE-2012-0507**, **CVE-2013-0074**. The screenshot of an advertising forum post can be seen on **Figure 1**.

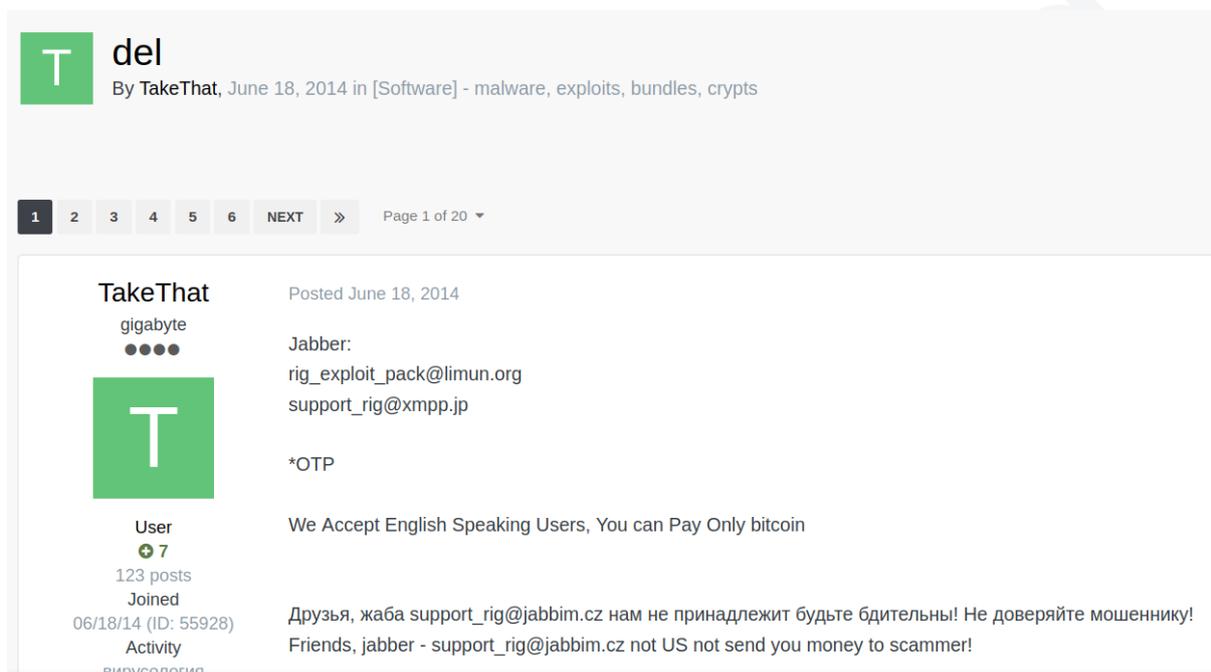

Figure 1. A forum post promoting RIG EK.

#### 3.2 Takedown Operation

After operating for a year, its source code is leaked and started getting distributed across forums. Two years after this major blow, it got hit by **Operation Shadowfall**, a coordinated takedown operation organized by the RSA organization. [2] This led to RIG EK significantly downsizing its operations for a period of time.

### 3.3 A Change of Malware

During this time, RIG EK was mainly distributing **Raccoon Stealer**. However, after the death of Raccoon's maintainer due to the Russian advances on Ukraine, it was forced to switch into distributing **Dridex** [4]. This was one of the main events that caused the PTI team to be interested in RIG EK.

A short while after continuing its operations despite this event, RIG EK's operator announces the shutdown of the kit on the very same forum it was announced. The post of the announcement can be found in **Figure 2**. It translates into "We are pausing our RIG3 operation for an indefinite amount of time."

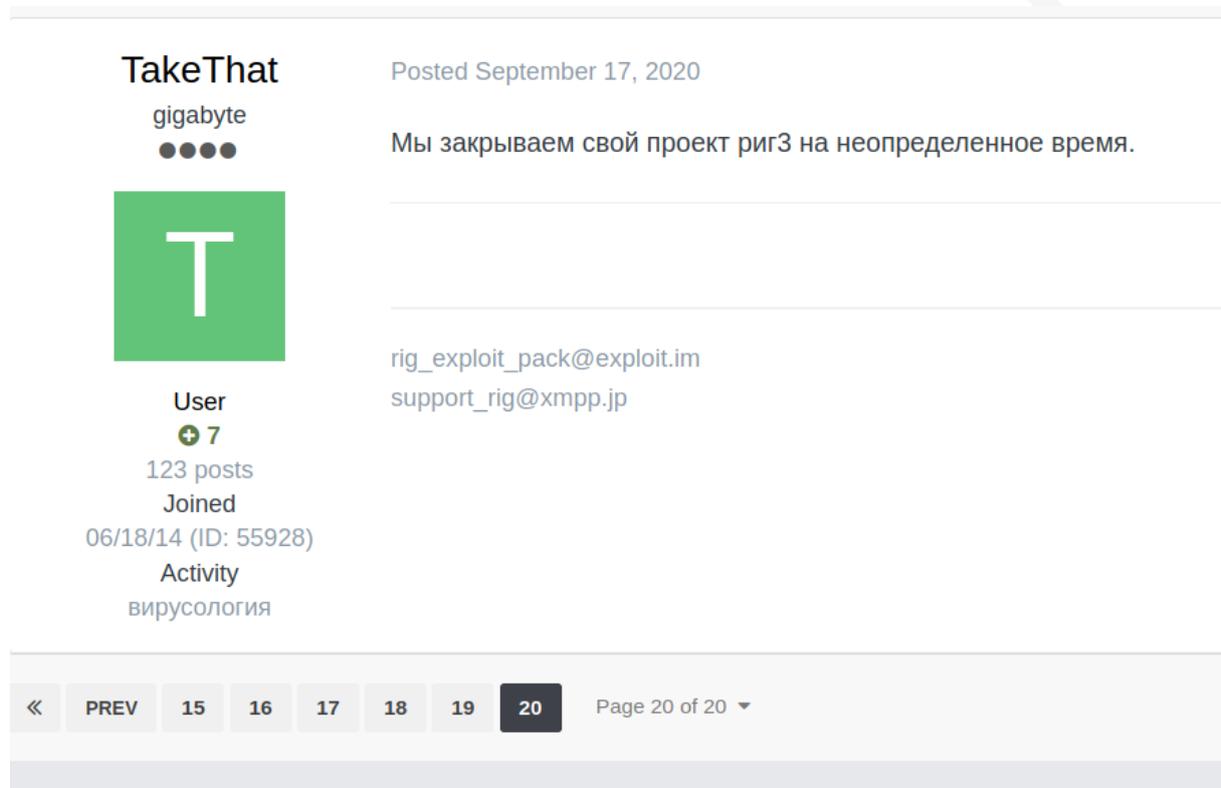

Figure 2. A forum post announcing RIG's shutdown.

### 3.4 Resurfacing

A year after the closing announcement, RIG EK resurfaces with a new and more modern set of exploits. The source code leak has raised some concerns among the PTI team on whether the person operating the RIG EK before and after the shutdown was the same person. Those concerns were addressed after the discovery that both new and old instances of the RIG EK uses the same VDS server. This conclusion was also supported by the connections. In the new RIG instance, the exploit kit was packing two shiny new exploits : **CVE-2021-26411** and **CVE-2020-0674**. With this new technical advance, its successful exploitation skyrocketed and reached an all time high of **30%** in 2022.

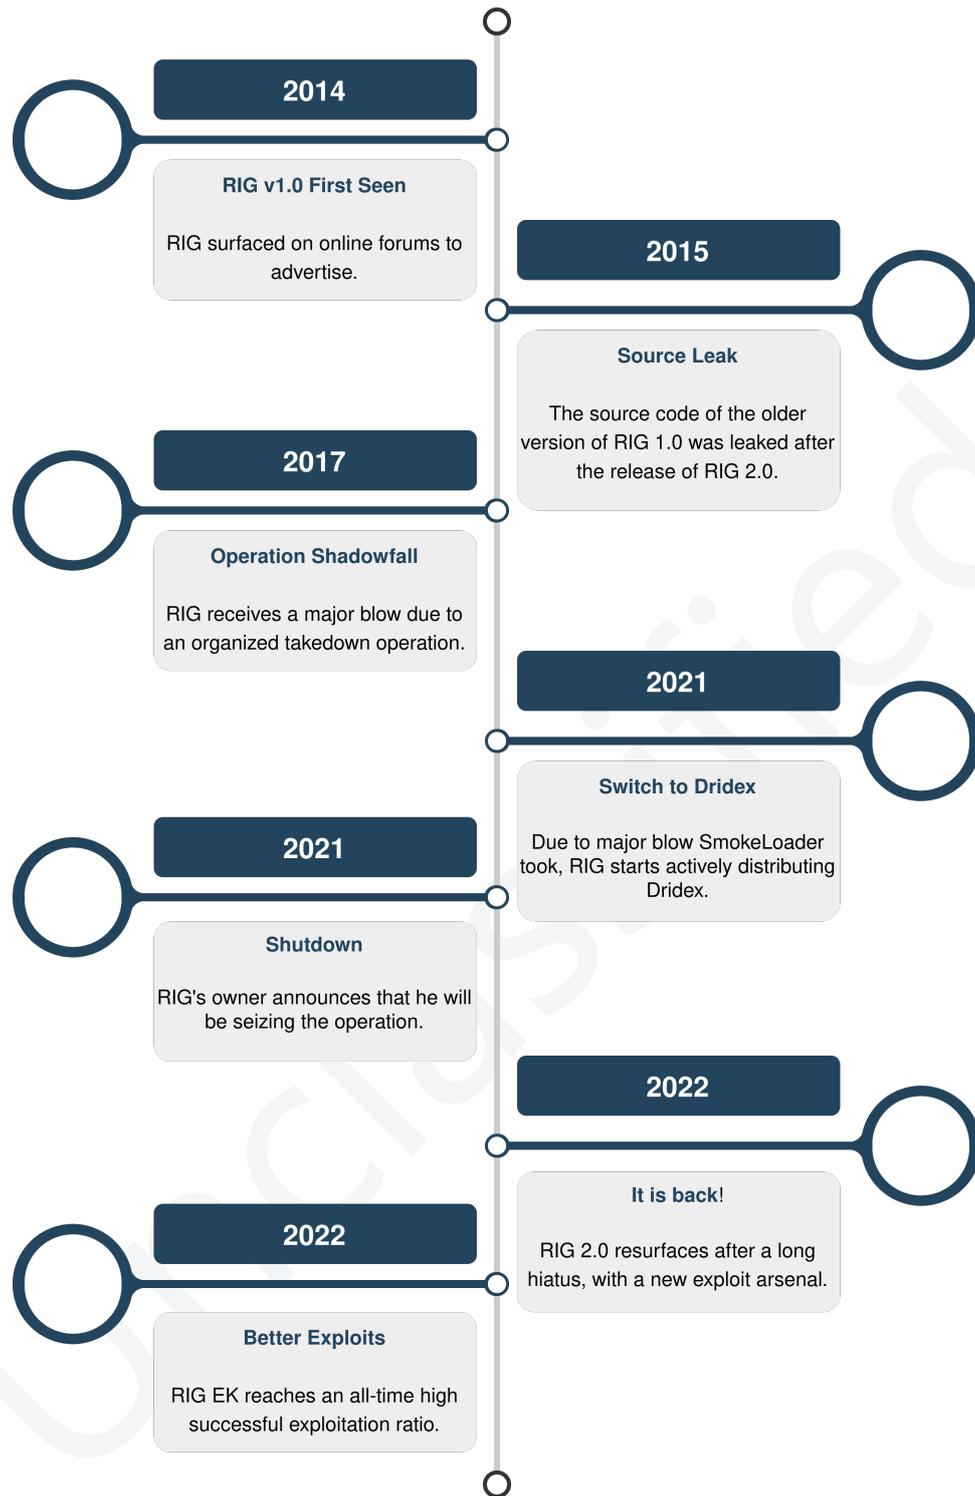

Figure 3. A timeline of RIG pertaining to the most important points during its life.

## 4 Technical Analysis

This section contains a technical analysis of the RIG Exploit Kit. Exploit kits are used for spreading malware by using predefined exploits. The RIG Exploit Kit is known as a dropper helping the spread of the malware [3] such as **RTM banking** malware [5], **Dridex** [4], **Raccoon Stealer** [6], **CryptoBit** ransomware [7], and **AZORult** malware [1] since 2014. Recently, it is used as a dropper for SmokeLoader and Ursnif.

### 4.1 Profiling

Since the main purpose of RIG EK is to gain access to victim computers and hand that access over to other threat actors, it makes use of **Resource Development, Initial Access** and **Execution** TTPs.

#### 4.1.1 Resource Development

RIG EK uses already known vulnerabilities in browsers to execute commands in victim machines. The exploits used for these vulnerabilities do not appear to be custom developed by the RIG author or anyone else. Rather, they appear to be slightly modified versions of publicly available exploits, usually (but not always) obfuscated to hide the code. This behavior falls under the **T1588, Obtain Capabilities**<sup>1</sup> TTP. Moreover, RIG EK uses malvertising and compromised websites to redirect worthy users into its landing page. This correlates with the TTP **T1584, Compromise Infrastructure**<sup>2</sup>.

#### 4.1.2 Initial Access

The exploits of RIG EK are delivered to unsuspecting victims in two ways. Either via malvertising, where users are redirected to online advertising pages that are tricked to execute the RIG exploits on their browser. Or when they visit sites that were compromised and the exploit kit's javascript was injected. In either way, the users hardly ever notice that anything malignant has ever occurred on their systems and go on with their daily browsing activities. Due to the very limited interaction and non-disrupting nature of this process, this technique can be deemed **T1189, Drive-by Compromise**<sup>3</sup>.

#### 4.1.3 Execution

After the exploit kit is successfully executed on the victim machine, it runs an obfuscated powershell script that fetches a malware from the RIG EK C&C infrastructure. This falls under the **T1059, Command and Scripting Interpreter**<sup>4</sup> TTP. Meanwhile, since the script was initially executed via the exploitation of a known vulnerability in the victim's system, it can be said that the TTP **T1203, Exploitation for Client Execution**<sup>5</sup> is also made use of by RIG EK.

3. <https://attack.mitre.org/techniques/T1189/>

4. <https://attack.mitre.org/techniques/T1059/>

5. <https://attack.mitre.org/techniques/T1203/>

## 4.2 C&C Infrastructure

The threat actors that maintain the RIG exploit kit modernized and changed their codebase but did not change their infrastructure [8] since their source leak in 2015. Also, it is discovered that they did not update their configuration constants like XOR keys and API keys.

The infrastructure had three keystones. These are the Virtual Dedicated Servers (VDS) (a.k.a. the exploitation server), the proxy server, and the API server. The API serves the exploit in an iframe or an under pop through the proxy server. (Figure 4)

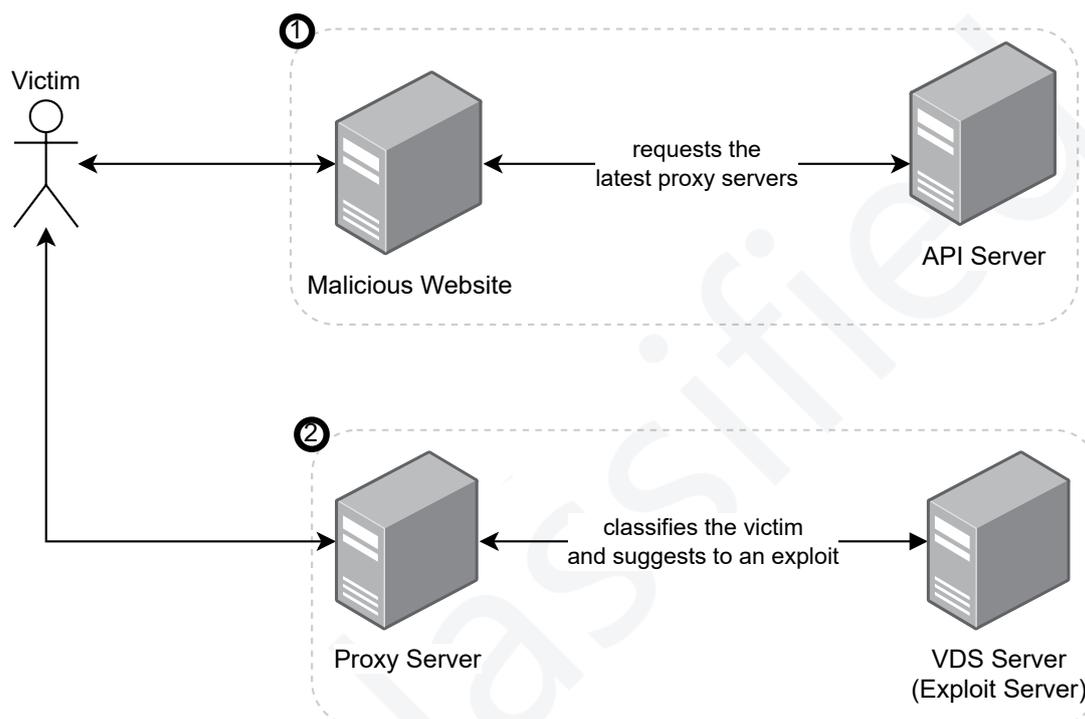

Figure 4. The infrastructure of the RIG exploit kit.

The proxy server is a reverse proxy to the exploit server. The proxy server uses a pre-shared protocol with the VDS. In that protocol, the first step is serializing the HTTP request with the referral site's information. Then it redirects the exploit server's response to the victim's browser. The referral sites information is stored for statistical presentation in the management panel.

The exploit server detects user's browser by parsing the "User-Agent" header. If the version of the browser matches the pre-defined vulnerable browser versions, then the exploit kit returns the suggested exploit code encrypted with custom version of RC4 algorithm.

The exploit server had six different exploits. Based on the PTI teams analysis, every exploit inside the RIG exploit kit, are weaponized versions of publicly available proof of concept (PoC) exploits codes. According to the exploit statistics, the actors are only using two of these exploits actively.

These exploits are :

- CVE-2013-2551
- CVE-2014-6332
- CVE-2015-0313
- CVE-2015-2419
- CVE-2016-0189
- CVE-2019-0752
- CVE-2018-8174

Since RIG EK has resurfaced, the group has expanded their arsenal with two new exploits that are used actively :

- CVE-2021-26411
- CVE-2020-0674

### 4.3 Management Panel

Multiple users use the management panel with various privilege levels. The PTI team monitored the management panel and its users cautiously, and the below table shows the active users and their respective roles in the system.

Username	Privilege
admin	admin
vipr	admin
pit/pitty	subadmin
lyr	user
ump	user
test1	user

Since the user **admin** is a dummy user used for creating other users, actors used the **pitty** user for managing the panel. The management panel works with a subscription model. The subscription of the only existing user, pitty, ended on the 5th of June, 2022. (as shown in Figure 5)

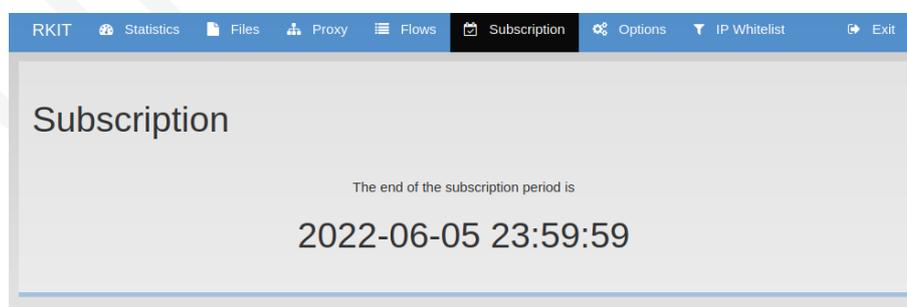

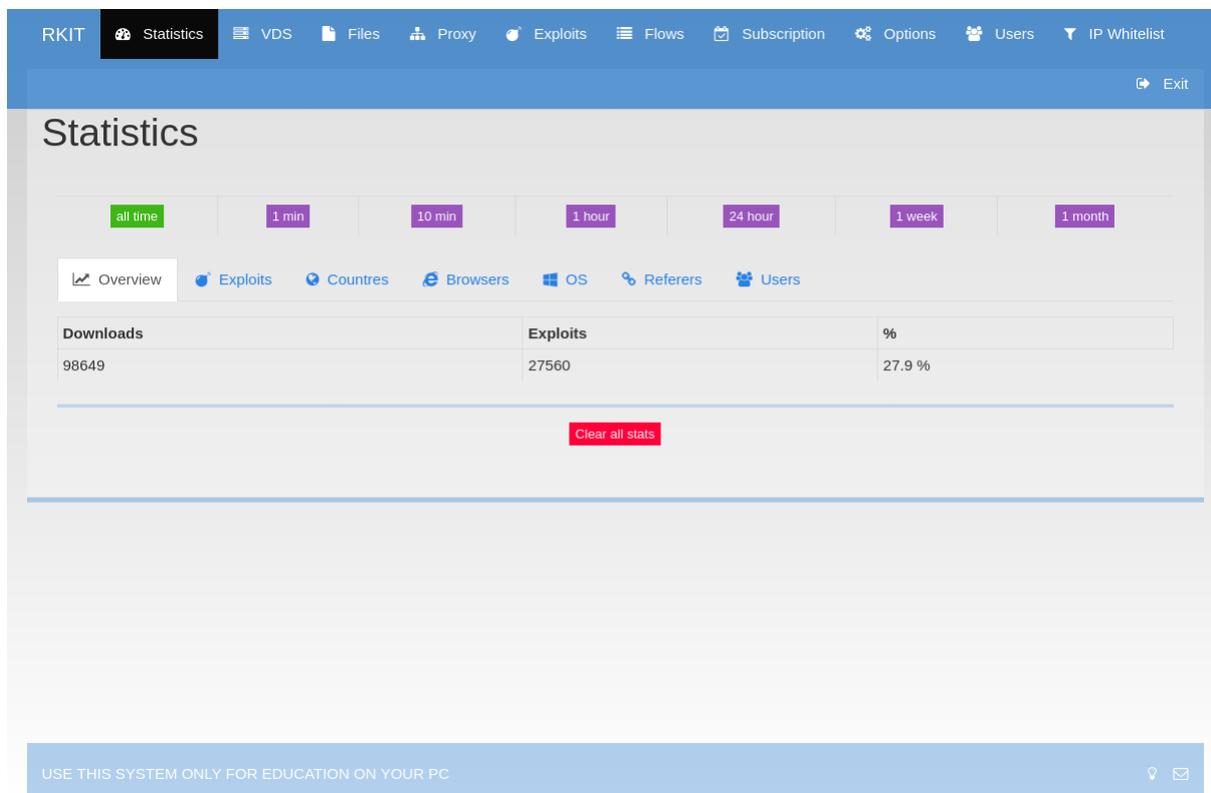

Figure 5. The actor pitty's subscription information.

The main page of the management panel shows the exploit kits statistics (as shown in Figure 6). The panel lets the actor filter the statistics by time, exploits, countries, browsers, the operating system, referrer websites, and the panel users.

**Figure 6. The management page welcomes the actor with the statistics page.**

The panel lets its users run multiple flows (campaigns). Each flow had a revocable unique token (Figure 7). The tokens are used for identifying the flow when serving the relevant exploits to the victims. Some of the flow names found during the investigation are :

- DanFuz Buba TOP 43k
- DanFuz Buba
- TEST MAGMA RIG
- ZWhttp
- godf WW 10k
- DanFuz WW 42k
- ANKL JP

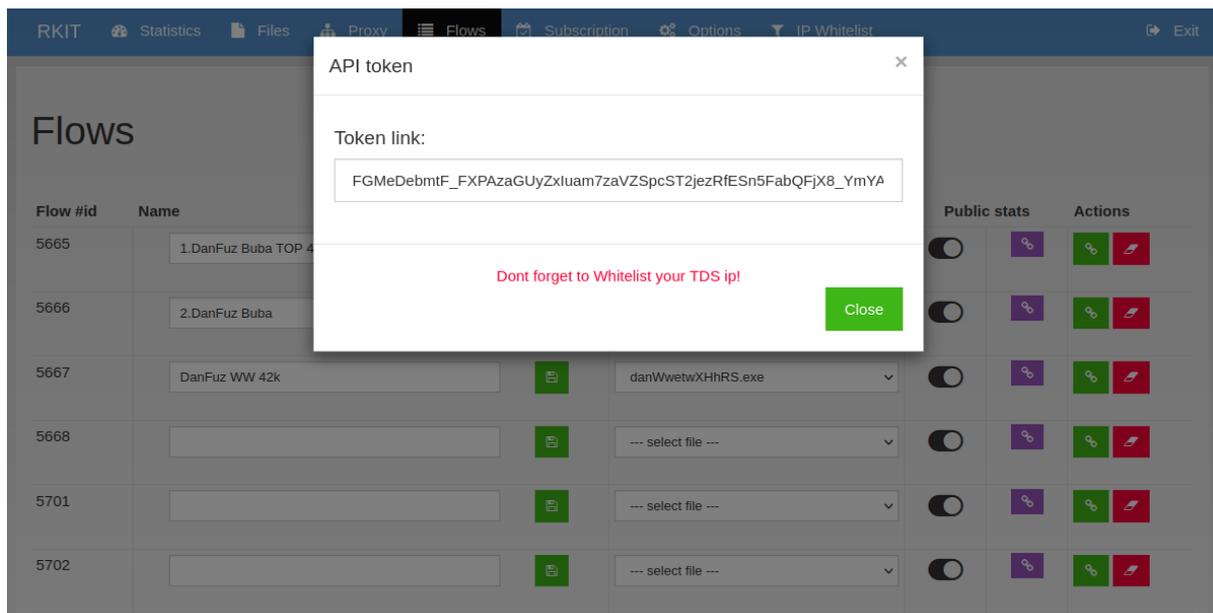

Figure 7. A flow created by the threat actor and the flows key.

The "Files" page on the panel allows uploading, managing, and scanning files. Files could be uploaded in two ways. First way is to upload files directly from a disk or an URL. The second way is to define an auto-update URL. With an auto-update URL, the panel will fetch the URL in intervals and update the file periodically (Figure 8).

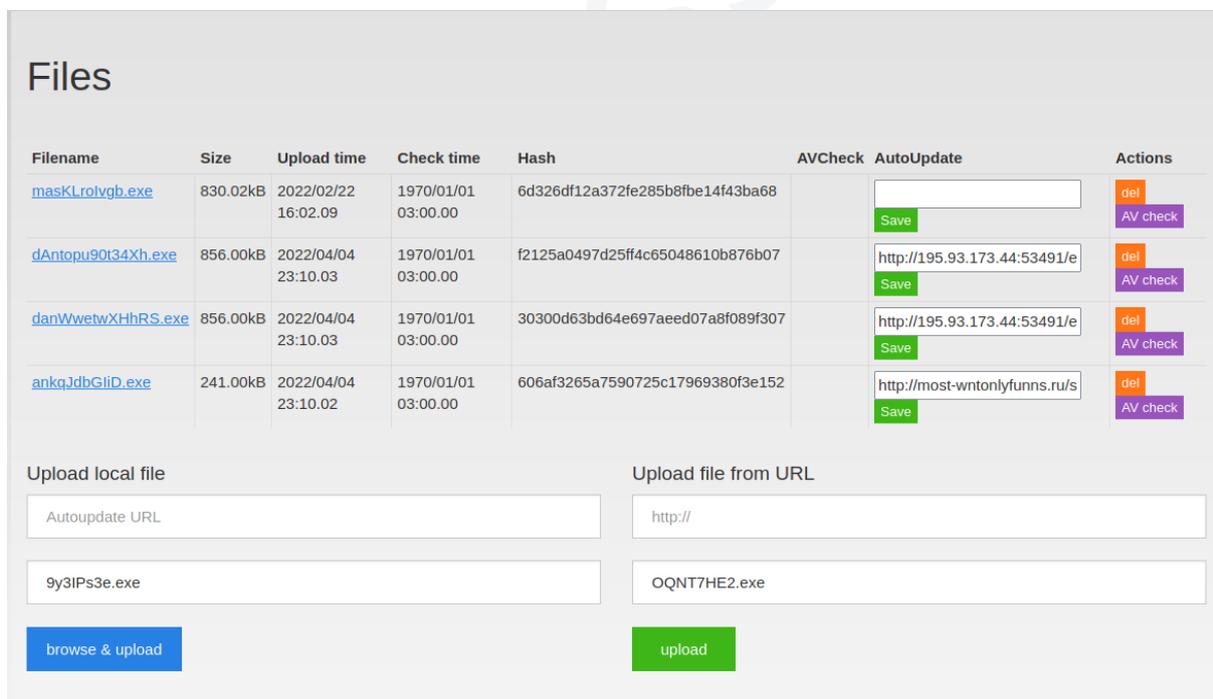

Figure 8. The malware upload page of the system.

The management panel allows managing the reverse proxies as well (Figure 9). These proxies are used for hiding the exploit server from being exposed to the public.

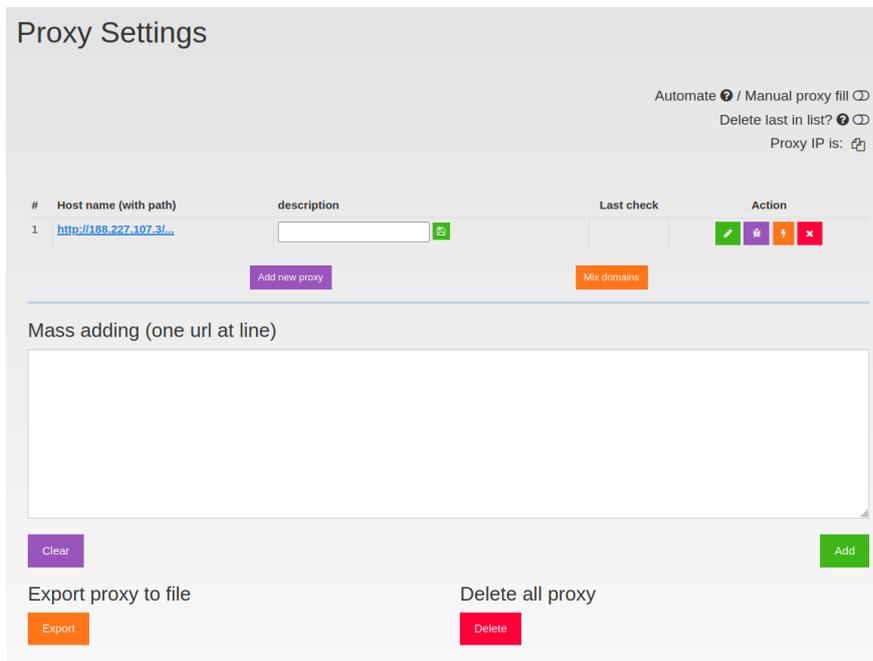

Figure 9. Proxy management page.

The panel allows the admin users to download the exploits from the exploit server (Figure 10).

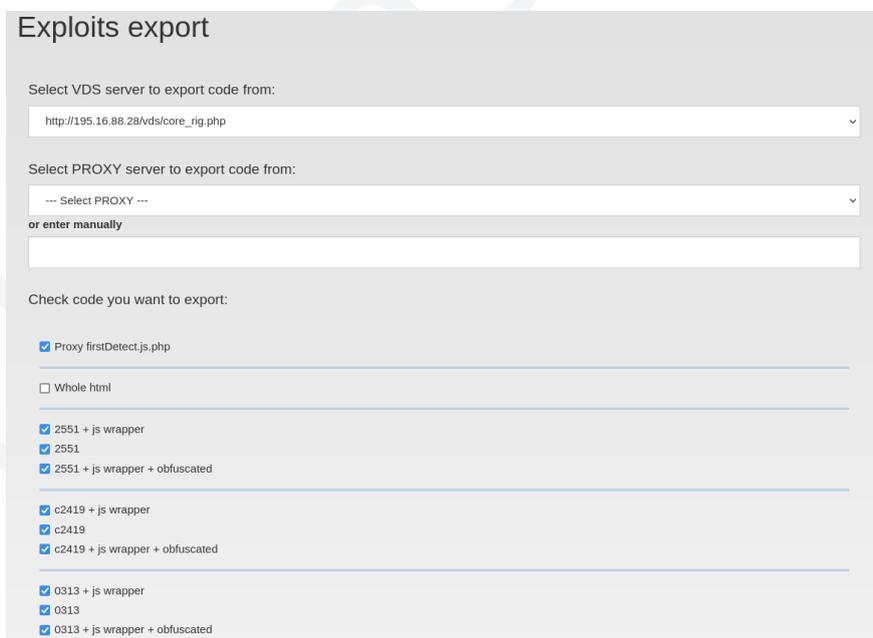

Figure 10. Exploit export page.

#### 4.4 Malware Distribution

RIG has been used to distribute different types of malware, mainly stealers, overtime. A list illustrating the malware the PTI team has observed is portrayed in Table 1.

Filename	Hash	Classification
Alx2v5WmfMzV.exe	4c4932a64047e4aa34c3fb1bcd96521e	Gozi
anKLpKggm0gb.exe	e449924b8aa04fa2e032511cf86d2482	SmokeLoader

GerxlfwewM.exe	4ed2076ec15170d68a88d8b4db34fff1	UrSnif
gErVP6ZddBw.exe	6b3d119e8c22e8670deb3a4f79646495	Royal Ransomware
DVqj6UhQ.exe	6cb6a59dc12494d5c5224fc03eb12ece	Royal Ransomware

**Table 1. Malware samples RIG EK was observed distributing**

This is only a small glimpse into the myriad of malware that RIG EK has been observed distributing. It is also used to distribute other types of malware from various groups. A more complete list of hashes can be found in Section 8.

## 5 De-Anonymization

This section is intentionally redacted for the public and is only available for law enforcement officers and trusted partner companies. Feel free to ask for a copy of the private release of this report.

## 6 Statistics and Observations

It is interesting to point out that the exploit kit got traffic from the **207 countries**. The following chart (Figure 11) shows the exploitation attempt count per country (and dependent areas) for two months.

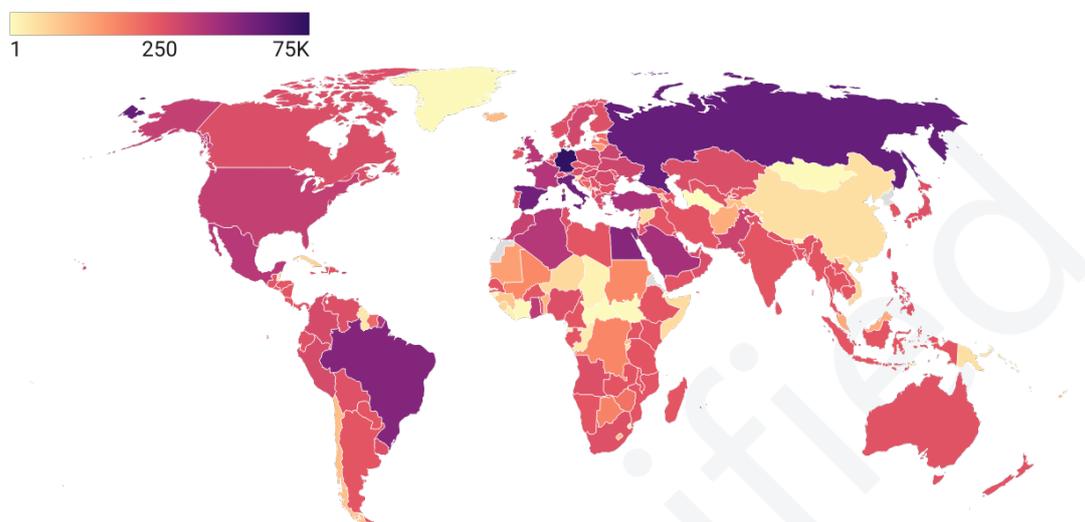

Figure 11. Exploitation attempts per country.

Exploit kit had **22%** (17647/81220) success rate in the last two months before its shutdown in 2021. The following chart (Figure 15) shows the successful exploitation attempts by country.

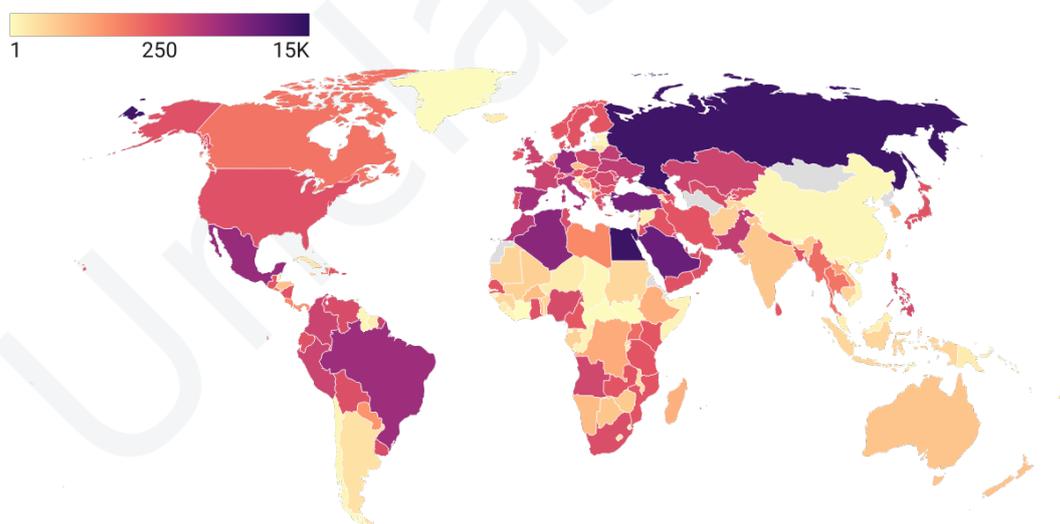

Figure 12. Successfully exploited machines per country.

Analyzing the exploitation attempt rates per day of week and percentage of successful exploitation also reveals some interesting trends. Taking a look at the chart below :

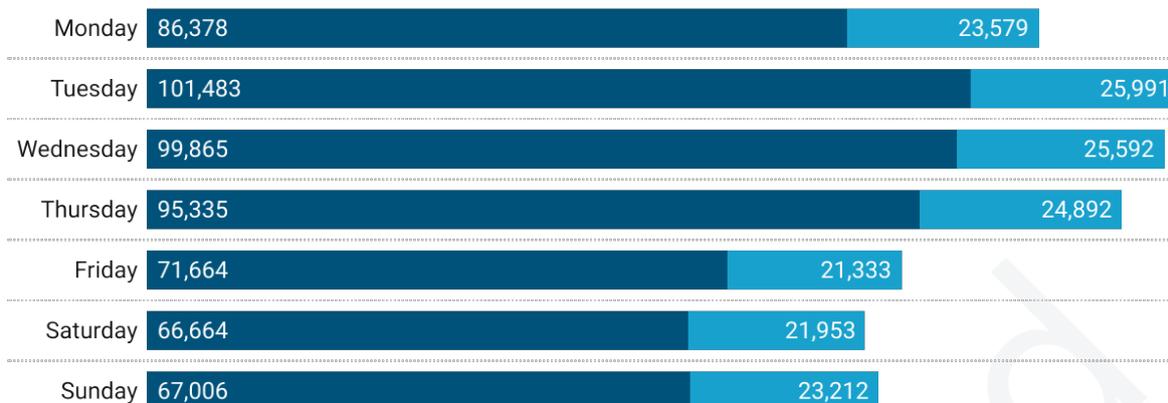

Figure 13. Exploit attempts and successful infections per day of week.

The RIG EK receives traffic from thousands of victims per day thanks to its malvertising campaigns. Nonetheless, what is most important for an exploit kit is the rate of successful exploitation. During its resurfacing at the end of 2022, it has consistently achieved a 30% exploitation rate among its victims. Even though throughout its lifetime, it has used numerous exploits, it has achieved the highest successful infection rate with CVE-2021-26411.

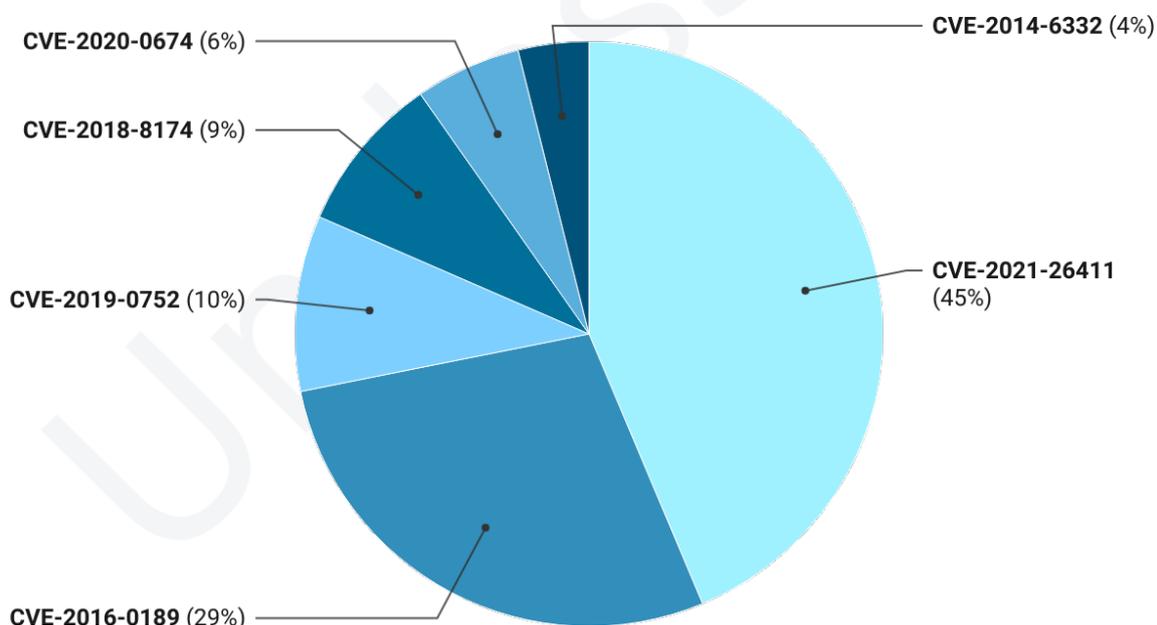

Figure 14. Successful exploitation rate per discovery date of exploit

As RIG EK is being distributed as a service model, it can distribute different types of malware, whilst all of them belong to different people and serve various purposes. However, statistics have showed us that most of the distributed malware are stealer examples.

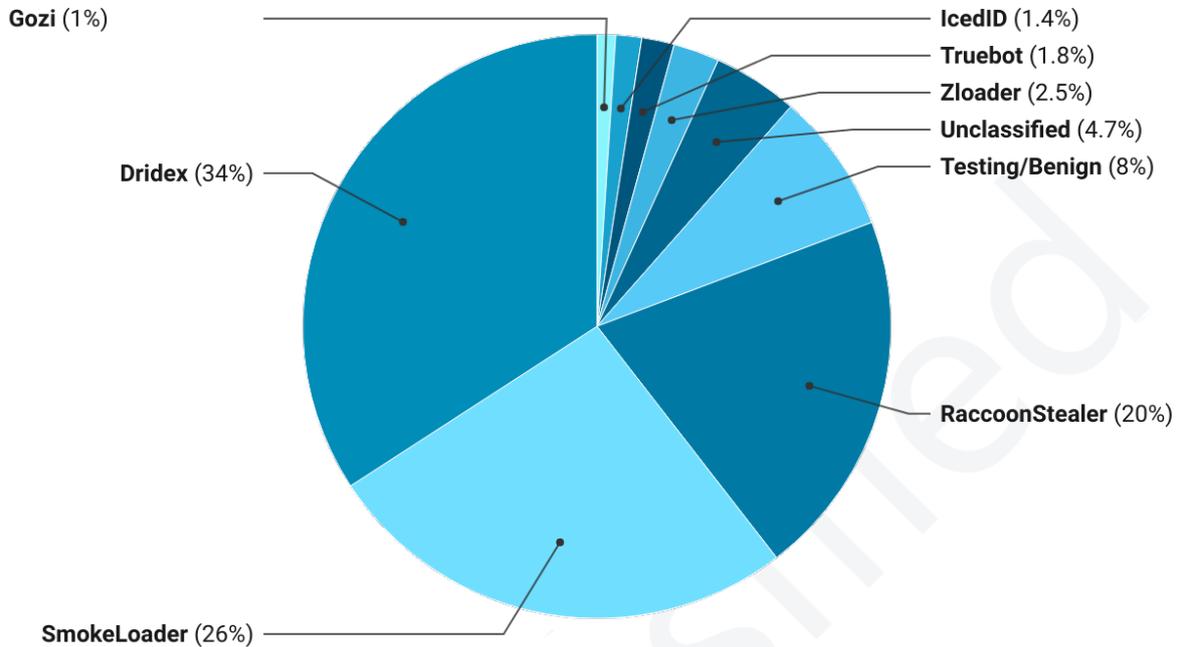

Figure 15. Distribution percentages per type of malware.

Overall, RIG EK runs a very fruitful business of exploit as-a-service, with victims across the globe, a highly effective exploit arsenal and numerous customers with constantly updating malware. There are only a handful of countries that has managed to stay untouched by its campaign and it receives a considerable amount of victims everyday.

## 7 Conclusion

This report focuses on researching and analyzing detailed information related to one of the most prominent exploit kits - the so-called **RIG EK**. As this exploit kit recently increased its activities, the report presents the reader with relevant data related to the C2 panel, new developments, threat actors in charge, technical evaluation, victim targeting and other operational details.

RIG EK has been on the scene since 2014 and due to its long-lasting activity, the type and version of the distributed malware are always changing. With **Dridex** being observed as the most common malware that is being dropped, targets are predominantly vulnerable machines that run outdated versions of Internet Explorer, making it easier to install the malware on them. The infection mainly happens through **malvertising** and **visiting compromised sites** and without any further action on the user side. Thanks to 2 new exploits, **CVE-2021-26411** and **CVE-2020-0674**, the exploitation rate reached **30%** in 2022. Financially motivated, the operators of RIG EK have the goal to gain access to victims' computers and further distribute and sell that access to other threat actors.

Furthermore, they managed to intercept victim traffic from 207 countries, with the most successful campaigns coming from Russia, Mexico, Brazil and the Middle East. Interestingly enough, the exploit try rates were the highest on **Tuesday, Wednesday** and **Thursday** - with successful infections taking place on the same days of the week. It is also noteworthy to mention that in addition to Dridex, the other popular types of distributed malware were stealers, such as **RaccoonStealer** or **SmokeLoader**. The report also highlights the advanced features of RIG EK, such as its use of proxy servers which makes infections harder to detect, and its integrated Antivirus testing feature, which controls for malicious software and whether any popular antivirus software caught it. The report assesses, with high confidence, that the developer of the Dridex malware has a close relationship with the RIG's admins, which further emphasizes the **sophistication and evolution** of RIG EK over the years.

In conclusion, the RIG EK exploit kit is **a significant threat** to corporations and end users. Its ability to infect devices with little to no interaction from the end user, coupled with its use of proxy servers, makes it harder to detect. The report highlights the need for organizations and individuals to remain vigilant and keep their software up-to-date to protect against this exploit kit and other similar threats.

### Acknowledgement

We would like to thank our advisors for their valuable guidance and support throughout this research.

The public version of the report will be shared from our github page<sup>6</sup>. The readers can find new samples, IOCs, and new versions of this report from our github page as we will constantly update our page based on new findings.

## Historique

Version	Date	Auteur(s)	Modifications
1.0	19.10.2021	PTI Team	Initial TLP:RED DRAFT release
1.1	25.10.2021	PTI Team	Updated De-anonymization section for LE
2.0	23.01.2023	PTI Team	TLP:RED Version
3.0	27.02.2023	PTI Team	TLP:CLEAR Version

Classified

Today's security professionals face a constant flood of “partially relatable” threat alerts and notifications from multiple vendors. The non-stop flow of unverified alerts creates an extremely demanding workload for security teams.

PRODAFT's threat intelligence platform reduces the time and energy spent on analysis, interpretation, and verification of potential threats. It gives security operatives on-demand insight into threat profiles on an individual basis.
